

CPSC 304 Project Cover Page

Milestone #: 1

Date: February 3rd, 2026

Group Number: 83

Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Umang Miteshbhai Bhavsar	13571278	q5n7h	umangbhavsar4@gmail.com
Anthony Leong	69730208	d3w1a	anthonyleong747@outlook.com
Yehor Skrypchenko	11036431	n8g3f	egor.skripch@gmail.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above.

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

A brief project description answering these questions:

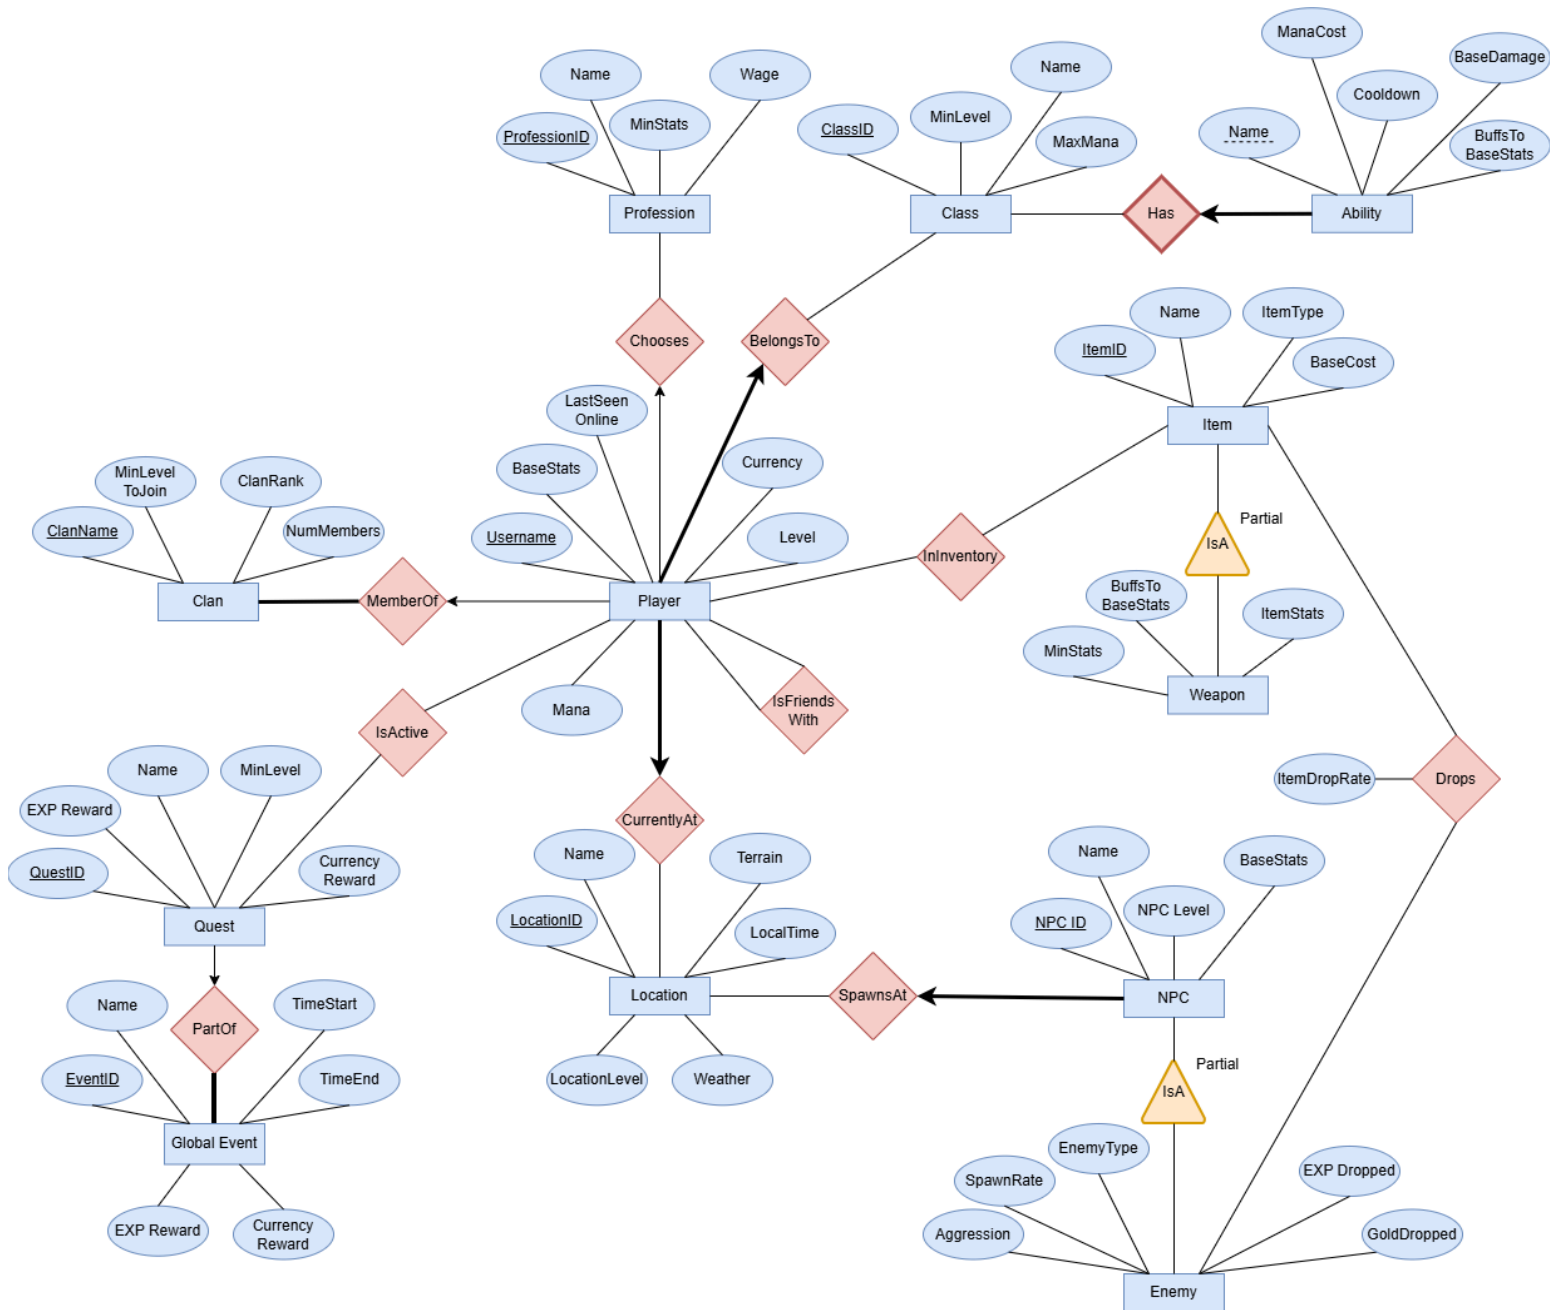

a. What is the domain of the application? Describe it.

The domain of an application refers to the area of knowledge your application resides in. For example, if I am making an application for a hospital, the domain would be something like healthcare/patient management/logistics (it would depend on what the application is trying to do).

- The domain of this application is the **moderation and management of a massively multiplayer online role-playing game (MMORPG)**. It focuses on the systems used to manage the players, non-playable characters (NPCs), items, quests, locations, etc. within an online role-playing environment. The application mainly supports the monitoring of gameplay mechanics, player progression, and in-game interactions.

b. What aspects of the domain are modeled by the database? In answering this question, you will want to talk about what your project is trying to address and how it fits within the domain. It is likely that in the process of answering these questions you will bring up examples of a real-life situation that the application could be applied to.

- The database models the core structural and operational components of an MMORPG. It represents players and their attributes such as level, currency, in-game stats, professions, etc. It also stores information about core game mechanics such as clans, quests, and global events. In addition, the database also manages in-game resources including weapons, items, abilities, inventories, as well as NPCs with their spawn behavior.
- A key real-world use case that this system supports is allowing game developers to easily make updates to existing aspects of the game, such as by modifying item stats, adjusting enemy difficulty, or introducing new quests. The database can also be used by game moderators to track player activity, manage clans, monitor player engagement, maintain fair gameplay, etc.
- Overall, the database provides a centralized structure for controlling, analyzing and updating the core elements of an MMORPG.

All attributes that are related to in-game stats (BaseStats of Player, BaseStats of NPC, ItemStats of Weapon, MinStats of Weapon, BufsToBaseStats of Weapon, BufsToBaseStats of Ability) are all placeholders for multiple attributes. They were abstracted to reduce clutter and keep the focus of this milestone on the conceptual design of the database rather than designing specific game mechanics.
